- 20. (Currently amended) An apparatus for creating high crown and camber curvature in slider materials having an air bearing surface and a flex side, comprising:
- a laser which produces a pulsed laser beam for machining the slider material, the laser beam having a pulse width in the range of 1 X 10⁻⁹ seconds to 1 X 10⁻³ seconds, with an energy per pulse in the range of 1 to 1,000,000 microJoules, and a repetition rate between 1Hz and 400Hz;
- at least one beam directing device, which directs the laser beam onto the flex side of the slider material; and
 - a fluence varying device so that optimal fluence is achieved to produce optimal curvature.
- 1 21. (Original) The apparatus of claim 20, wherein:
 - the fluence varying device is at least one focusing lens which directs the laser beam to focus within a focal plane and
- 4 a movable fixture which varies the position of the slider material with respect to the focal plane.
- 1 22. (Original) The apparatus of claim 21, wherein:
- the movable fixture is a movable stage upon which the slider material is attached, and by which the slider material is moved relative to the focal plane.
- 1 23. (Original) The apparatus of claim 21, wherein:
- the movable fixture is a movable stage upon which the lens is attached, and by which the focal plane is moved relative to the slider material.
- 1 24. (Original) The apparatus of claim 20, wherein the laser is Q-switched.
- 1 25. (Original) The apparatus of claim 20, wherein the laser beam is produced through harmonic
- 2 generation.
- 1 26. (Original) The apparatus of claim 20, wherein the laser beam is moved by at least one
- 2 directing device.
- 1 27. (Original) The apparatus of claim 26, wherein at least one directing optic includes at least
- 2 one reflecting mirror.
- 1 28. (Original) The apparatus of claim 20, wherein the laser beam is conditioned with a beam
- 2 expander that has adjustable beam expansion.

- 1 29. (Original) The apparatus of claim 20, wherein the slider material is one or more rows of
- 2 sliders.
